FlatPack.com

Our projects:

Flatpack.com® aims to solve the hard process of finding and buying houses that are done and complete. Everything from searching, buying and submitting estates simply, in one place. We aim to reach buyers and sellers, all around the world, to research each other, with some simple steps, on any device!

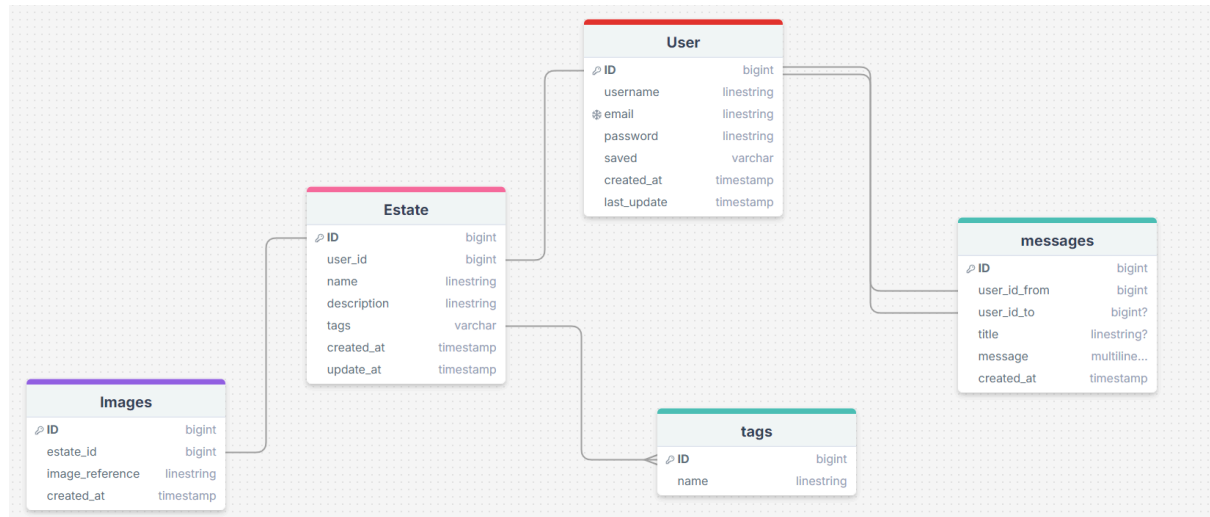

Used languages, pattern and technologies:

We use the PHP 8.2 version for the development of the backend part, and the latest version of Vite + React technology for the frontend development.

We use in our projects the MVC (Modell View Controller) pattern in the PHP Laravel Framework.

We use mySQL database technology for the proper management and storage of data.

Developer environments:

During the preparation of the project, we will use the latest versions of the JetBrains PhpStorm and XAMPP applications.
